

Presentation Plan — DzDataAutomate Jury Defense

Target length: 15-20 minutes | Recommended: 16 slides + Q&A buffer

Rule of thumb: aim for ~1 minute per slide on average, but weight time toward the slides that carry the most jury-evaluation weight (problem framing, innovation, market analysis, financials, prototype demo). Practice with a timer — this plan totals **17 minutes**, leaving 3 minutes of slack for transitions and a breath before Q&A.

Timing Overview

Section	Slides	Time
Opening	1-2	1.5 min
Project Presentation	3-5	3 min
Innovative Aspect	6-7	2.5 min
Strategic Market Analysis	8-9	2.5 min
Production & Organization	10	1.5 min
Financial Plan	11-12	2.5 min
Prototype Demo	13-15	3.5 min
Closing	16	1.5 min
Total	16 slides	~17 min

SLIDE 1 — Title Slide

Time: 0:45

Content:

- Project name: **DzDataAutomate**
- Tagline: "Data Science Automation, made for everyone"
- Team names: Benoudjit Lyne, Chikhi Mey Aya, Djouzi Nour El Houda
- Specialization: AI & Data Science — ESTIN
- Supervisors: Dr. Benslimane Salim, Dr. Amara Karima
- Academic year 2025/2026, framed under Ministerial Order 1275

Visuals:

- ESTIN / Estinup logos (top corners, as in the cover page)
- A clean, dark-themed background echoing the prototype's visual identity (continuity with Figures 4-10)
- Optional: a subtle icon motif (data flow / pipeline arrows) to foreshadow the product

Speaker note: State your names once, briskly, then move — the jury already has this from the cover page.

SLIDE 2 — The Problem (Hook)

Time: 0:45

Content:

- One sentence framing: *"Algerian businesses, students, and NGOs collect data every day — but almost none of them can use it."*
- 3 short example personas: boutique owner in Algiers, NGO officer in Batna, master's student
- The paradox: *they have the data, but not the means to understand it*

Visuals:

- 3 simple persona icons (shop, clipboard/NGO, graduation cap) with one-line captions each
- No bullet-heavy text — this slide should feel like a hook, not a report excerpt

Speaker note: Open with this slide as a story, not a list — it sets emotional stakes before you get technical.

SLIDE 3 — The Project Idea

Time: 1 min

Content:

- DzDataAutomate: an intelligent web platform automating the full data science workflow
- No installation, no code, no configuration — user states their goal in plain language, uploads CSV/Excel, gets a report + reproducible script
- Built on open-source: Python, Streamlit/React, Pandas, Scikit-learn, Plotly

Visuals:

- A simple horizontal flow diagram: **Upload → Clean → Visualize → Understand (AI) → Act/Export**
 - This previews the 5-stage pipeline you'll return to in the prototype section — repeat this exact visual motif there for continuity
-

SLIDE 4 — Proposed Values

Time: 1 min

Content:

- Reuse the 9 value dimensions: Modernity, Performance, Flexibility, Task Accomplishment, User-Centered Design, Cost Reduction, Risk Reduction, Accessibility, Ease of Use
- Don't read all 9 aloud — group them into 3 clusters when speaking: **(1) Accessible & affordable, (2) Fast & reliable, (3) Private & user-centered**

Visuals:

- Directly adapt **Figure 1** (Proposed value dimensions) — it's already a clean radial/grid layout, reuse its structure
 - Keep icons small and consistent in style
-

SLIDE 5 — Team & Objectives

Time: 1 min

Content:

- Brief team roles (one line each): Backend & AI integration / Frontend & UX / ML pipeline & docs
- Objectives timeline: **Year 1** — 100 active users · **Year 3** — 500 paying SME clients, 3 university partnerships · **Year 5** — reference platform, 15% of Algerian SME analytics segment
- 10-month project timeline reference

Visuals:

- A simple 3-point horizontal milestone timeline (Y1 → Y3 → Y5) with one stat per milestone in large callout numbers (100 / 500 / 15%)
 - Small headshot-style icons or initials for the 3 team members (no need for photos)
-

SLIDE 6 — What Makes This Innovative

Time: 1 min

Content:

- Frame clearly: *not a new ML algorithm — a new way of delivering data science*
- 4 innovation domains as a 2×2 grid:
 1. **New Process** — automated 4-stage pipeline (minutes, not days)
 2. **New Functionality** — intent-driven AI suggestion cards
 3. **New Customers** — the non-technical majority
 4. **New Offer** — privacy-preserving, offline-compatible

Visuals:

- 2×2 grid layout, one icon per quadrant (gear/automation, lightbulb/AI, people/customers, shield/privacy)
 - This is a high-density slide — keep each quadrant to 1 short phrase, not a paragraph
-

SLIDE 7 — The Core Innovation: Intent-Driven AI Analysis

Time: 1.5 min

Content:

- Explain the inversion: instead of the user formulating a query, the platform asks 2 simple questions (data type + goal) and *generates* relevant suggestions
- Example: "Which product generated the most revenue last quarter?" — clickable card, not a query
- Local LLM via Ollama → privacy-preserving, no raw data leaves the device
- Graceful fallback if AI is unavailable (reliability point — jury likes this)

Visuals:

- A small before/after comparison: **Traditional tools** (user must know what to ask) vs. **DzDataAutomate** (platform proposes the question)
- Could reuse a simplified version of the AI suggestion card visual from **Figure 8** (the "AI Suggestion — Pattern Detected" card)

Speaker note: This is your most distinctive slide — slow down slightly here, it's the differentiator the jury will remember.

SLIDE 8 — Competitive Landscape

Time: 1.25 min

Content:

- International competitors (DataRobot, Vertex AI, Power BI, KNIME, RapidMiner, Orange) — powerful but require technical expertise, cloud-only, expensive
- National competitors: **none** — Algerian market currently served only by consultants or manual Excel/Python work
- One-line synthesis: *the more powerful the tool, the less accessible it is — no one occupies the high-access/low-complexity space*

Visuals:

- Directly reuse **Figure 2** (Competitive positioning map) — it's the single most persuasive visual in the whole report. Let it occupy most of the slide.
-

SLIDE 9 — Comparative Table & Market Gaps

Time: 1.25 min

Content:

- Condense **Table 2** to the 4–5 most decision-relevant rows only: Non-technical accessibility, Natural language interaction, Deployment mode, Data privacy, Cost
- State the 3 market gaps in one line each: (1) no platform combines AutoML + non-technical UI + local language, (2) no local AI layer respects data sovereignty, (3) cost structures exclude SMEs

Visuals:

- Simplified comparison table (5 rows × competitors vs. DzDataAutomate column highlighted in accent color)
 - Don't reproduce all 10 columns from Table 2 — a dense table will hurt readability on a projector; pick what proves your point
-

SLIDE 10 — How the Platform Works (Production Process)

Time: 1.5 min

Content:

- Walk through the 8-step service delivery pipeline at a high level — don't read all 8 steps, group into the 5 visual stages: **Capture** → **Upload** → **Clean** → **Understand (AI)** →

Act/Export

- Emphasize: raw data never leaves the user's device; only statistical profile sent to AI; full deletion at session end

Visuals:

- Adapt **Figure 3** (Data science automation service delivery architecture) — this is dense in the report; simplify to show only the 5 stage headers with 1 icon and 1 short phrase each, not the full step lists
 - This is the slide most likely to overflow with text — be ruthless about cutting
-

SLIDE 11 — Infrastructure, Team & Key Partners

Time: 1.25 min

Content:

- Tech stack: React (Vercel) + FastAPI (Render), free tiers during prototype phase
- AI provider: Claude or OpenAI API (low token cost — only metadata transmitted)
- Payment: Chargily (local, supports CIB/Dahabia — important for Algeria)
- Key partners: CNESIIU/university incubators, local SME beta partners, AWS/GCP startup credits, open-source community (Scikit-learn, Kaggle)

Visuals:

- Simple icon row of the tech stack logos (React, FastAPI, Vercel, Render, Chargily) — recognizable, fast to scan
 - Small partner logos/icons cluster for CNESIIU, AWS/GCP, Kaggle
-

SLIDE 12 — Cost Structure & Financing

Time: 1.25 min

Content:

- Year 1 total budget: **104,000 DZD** — emphasize how low this is and why (student team, open-source, free hosting tiers)
- Financing sources: university incubator support → cloud startup credits → subscription revenue (no bank loan needed in years 1-2)
- Freemium model: free tier (3 datasets/month) + paid tier (500 DZD/month, unlimited + predictive + export)

Visuals:

- A simple cost breakdown donut or bar chart from **Table 3** (group into 3–4 categories: hosting/infra, AI API, marketing, tools/contingency — don't show all 9 line items)
 - One large callout number: **104,000 DZD** total year 1 budget
-

SLIDE 13 — Revenue & Path to Profitability

Time: 1.25 min

Content:

- Two scenarios: optimistic vs. pessimistic subscription growth (from Table 4)
- Operating result turns positive from year N (+188K DZD) and grows steadily to +6,958K DZD by N+5
- Monthly cash flow breakeven at month 4; cumulative cash balance positive by month 8 (188,000 DZD surplus year 1)
- BFR ≈ 0 (pay-before-use SaaS model — no working capital financing needed)

Visuals:

- A simple line chart: Net Result trajectory N $\rightarrow$ N+5 (optimistic vs pessimistic, two lines) — derived from **Table 5**
- Optional second small chart: cumulative treasury curve crossing zero at month 8, from **Table 6**

Speaker note: Don't read numbers off the table — point at the trend line and state the 2–3 headline figures only (104K budget, breakeven month 4, +188K Y1 surplus).

SLIDE 14 — Prototype Walkthrough Part 1: Capture $\rightarrow$ Clean

Time: 1.75 min

Content:

- Screen 1: Sign-up & professional domain selection — intent capture at registration (8 sector cards)
- Screen 2: Dashboard & upload — trust signals (encryption, compliance, API) placed at point of hesitation
- Screen 3: Data Passport — instant scan, plain-language data quality flags (e.g., "14% inconsistent date formats")
- Screen 4: Automated cleaning report — issue table with severity + one-click actions

Visuals:

- Use **Figures 4, 5, 6, 7** as a 2×2 thumbnail grid, or step through 2 at a time if you have screen-recording/live demo capability
 - If doing a **live demo** instead of static screenshots, say so explicitly here and keep a screenshot backup slide in case of technical failure
-

SLIDE 15 — Prototype Walkthrough Part 2: Visualize → Understand → Act

Time: 1.75 min

Content:

- Screen 5: Interactive visualization — live chart config, AI-detected correlation suggestion
- Screen 6: AI Strategic Insights — locally-deployed assistant, plain-language findings, natural-language follow-up question box
- Screen 7: Export dashboard — PDF report, cleaned CSV, reproducible Python notebook

Visuals:

- **Figures 8, 9, 10** as sequential full-width images (one per click/transition) — these are your strongest "proof it's real" visuals, give them room to breathe
 - End on Figure 10 (export dashboard) since it visually closes the loop: raw file in → deliverables out
-

SLIDE 16 — Conclusion & Vision

Time: 1 min

Content:

- Recap in one sentence: technically sound, strategically defensible, financially self-sustaining within year 1
- Future directions: clustering/anomaly/time-series modules, Arabic-language interface, formal incubator + SME partnerships
- Closing line: ambition to become the reference platform for data-driven decision-making in Algeria and North Africa

Visuals:

- Return to the title slide's visual theme for symmetry (dark background, same logo placement)

- Optional: small roadmap arrow (Now → Year 1 → Year 3 → Year 5) reusing the milestone numbers from Slide 5

Speaker note: End on the vision sentence, not on a numbers table — last impression should be ambition, not arithmetic. Thank the jury and invite questions.

General Delivery Notes

- **Rehearse against a timer per section**, not just total time — the financial and prototype sections are where teams typically overrun.
- **Designate one speaker per major section** (e.g., Idea/Innovation → one member, Market/Financials → second member, Prototype demo → third member) so the jury sees all three of you contribute, matching the "collaborative work" note in your team section.
- **Have a screenshot fallback** for the prototype slides even if you plan a live demo — jury rooms have unreliable Wi-Fi/projectors.
- **Don't read tables aloud.** Every numeric table in this plan (Tables 2-6) has been reduced to 1-3 headline figures per slide — trust the visual, narrate the takeaway.
- Keep slide text under ~40 words per slide where possible; the speaking notes carry the detail, the slide carries the memory hook.
